

# STAAD — Product Requirements Document (PRD)

## Product Overview

---

STAAD is a modern online therapy platform designed specifically for therapists working with SLD, ADHD, Anxiety, Depression, Intellectual Disability, Dyslexia, and Autism.

The platform combines secure live video conferencing, interactive therapy modules, real-time collaborative activities, session tracking, and a plugin-based therapy module system.

Core USP:

During live therapy sessions, both therapist and client can simultaneously interact with therapy modules like Maze, Bubble Splash, Talking Calculator, Matching Games, Attention Tasks, and Memory Games.

## Primary Goal

---

Build a production-ready MVP using mostly free/serverless tools with clean architecture, scalable plugin system, responsive UI, minimalistic design, calm therapy-focused aesthetics, and maintainable codebase.

## Design Language

---

- Calm sage green palette
- Minimal text-heavy UI
- Large breathing spaces
- Rounded corners
- Soft shadows
- Warm off-white background
- DM Sans + DM Serif typography
- Emotionally calming interface

## Frontend Stack

---

- Next.js 14 App Router
- TypeScript
- TailwindCSS
- Framer Motion
- ShadCN UI
- Zustand
- React Query / TanStack Query

Deployment:

- Vercel free tier

## Authentication

---

Use Firebase Authentication with:

- Google OAuth
- Email/password
- Role-based authentication

Roles:

- therapist
- client
- admin

## Database Architecture

---

Firestore is used for realtime session state and collaborative synchronization.

Neon Postgres is used for structured relational data like:

- users
- therapists
- clients
- bookings

- therapist notes
- progress reports
- billing

## Storage

---

Use Cloudflare R2 for:

- profile images
- worksheets
- reports
- therapy assets
- exports

## Video Infrastructure

---

Use Daily.co SDK for:

- live video sessions
- screen sharing
- participant controls
- responsive layouts
- therapist-controlled sessions

## Core Features

---

1. Authentication & onboarding flow
2. Therapist dashboard
3. Realtime collaborative session room
4. Plugin-based therapy modules
5. Notifications
6. Analytics
7. Payments
8. Progress tracking

## Session Room Requirements

---

- Side-by-side video + module layout
- Floating controls
- Therapist module switching
- Firestore realtime sync
- Reconnect handling
- Low latency
- Optimistic updates
- Tablet support

## Therapy Module Plugin Contract

---

```
interface TherapyModule {  
  id: string  
  name: string  
  
  init(): void  
  
  onInput(data: any): void  
  
  getState(): any  
  
  setState(state: any): void  
  
  destroy(): void  
}
```

## Starter Therapy Modules

---

1. Maze
2. Bubble Splash
3. Talking Calculator
4. Memory Match
5. Emotion Cards

## Realtime Firestore Structure

---

```
liveSessions/  
  sessionId/  
    activeModule  
    participants  
    currentState  
    timestamps
```

```
moduleStates/  
  sessionId/  
    moduleId/  
      state  
      updatedBy  
      updatedAt
```

## Backend Requirements

---

Use Next.js API routes/server actions only.

Required APIs:

- booking creation
- session creation
- therapist notes
- analytics ingestion
- module registry
- payment webhooks

## Security Requirements

---

- Firebase security rules
- rate limiting
- role validation
- session authorization
- signed upload URLs
- secure environment variables
- Postgres RLS

## Build Phases

---

## PHASE 1

- onboarding
- auth
- therapist dashboard

## PHASE 2

- session room
- Daily.co integration
- realtime sync

## PHASE 3

- therapy modules
- plugin system

## PHASE 4

- analytics
- payments
- reports

## PHASE 5

- optimization
- testing
- deployment

## Success Criteria

---

The application should feel like:

“Figma-quality therapy software that is emotionally calming, technically reliable, and easy enough for therapists to use without training.”
